Mini-Project - FoodExpress

Ouvert le : mercredi 30 avril 2025, 16:30
À rendre : dimanche 18 mai 2025, 23:30

Project overview

FoodExpress is a startup focused on providing a seamless online food ordering experience.

You must develop a RESTful API using **Node.js** and **Express.js** (**Fastify.js** is also allowed) to handle user management, restaurant registration, and menu modifications.

Your API will have three main endpoints:

- `/users`
- `/restaurants`
- `/menus`

This project can be completed individually or in pairs.

Only the API is required (no frontend).

Required features:

Users endpoint (`/users`)

- CRUD operations (Create, Read, Update, Delete)
- User fields: `{id, email, username, password, role}`
- User roles: `"user"` or `"admin"`
- Users can create accounts without authentication.
- Regular users can only update/delete their own account.
- Admin users have full control over user accounts.
- Regular users cannot view other users' details.
- JWT authentication required:
    - Public access (no auth) for read operations on restaurants and menus.
    - Authenticated (stateless) access for write operations.

Restaurants endpoint (`/restaurants`)

- CRUD operations for restaurants
- Restaurant fields: `{id, name, address, phone, opening_hours}`
- Admin-only creation, updating, deletion
- Public read access with optional sorting by name/address
- Pagination with default limit (10, adjustable via query params)

Menus endpoint (`/menus`)

- CRUD operations for menus
- Menu fields: `{id, restaurant_id, name, description, price, category}`
- Admin-only creation, updating, deletion
- Public read access with sorting options (price, category)
- Pagination with default limit (10, adjustable)

Guidelines & tips

Authentication

- JWT-based authentication recommended
- Passport.js (`passport-local` strategy) suggested
- Token verification with jwt.io

Validation

- Use Joi, Yup, or AJV for input validation
- Validate user inputs through middleware

Documentation

- Swagger/OpenAPI standard required
- Clearly document endpoints (inputs, outputs, errors)
- Suggested tool: editor.swagger.io

Testing

- Essential tests required (use Jest or Mocha/Chai)
- Prioritize critical functionalities

Deliverables

Submit an archive containing:

- Complete source code
- API documentation (Swagger/OpenAPI)
- README with installation and running instructions
  Important: Non-runnable projects risk getting a 0.

Grading criteria

- Overall project architecture: 20 pts
- Authentication implementation: 15 pts
- Restaurant management:
  - Admin CRUD operations: 20 pts
  - Restaurant/menu listing with sorting/pagination: 20 pts
  - User permissions & access control: 15 pts
- Documentation and tests: 10 pts

Negative points (up to -10) for missing basic tests or incomplete documentation.
Up to 50% of points can be deducted for poor code quality or insecure practices.
