[Project] - Banking Security

Ouvert le : jeudi 15 mai 2025, 16:00
À rendre : jeudi 29 mai 2025, 23:59

---

1 - Project overview

You just joined the iBank company, a well known institution linked to financial activities. You are now in charge of the security of the day to day "run" involving all operations, hardware, software and public facing solution.

Your main goal is to design and present a large overall of the security system by changing processes, technologies and globally how the company (and people) see the security world

This project can be done in a group of 2 people.

2 - Features

You are in charge of writing and driving the security policies for a bank.
This bank is a worldwide bank, with customers using it 24/7. Your service need to be reliable and secure, your processes too!

Part of the bank assets, you will find multiples type of project in which you want to have a complete security. It is comprised at least of

- public tools like websites, mobiles apps and APIs
  - multiples public website like the one each client can use to do operations and check their accounts
  - mobile apps that allow the same operations, both on android and iOS
  - public APIs that allow the previous to get data but also user to "send" data to do specific operation (like send money)
- there is internal apps (not accessible from internet, only from computer inside the network)
  - for example desktop app or browser app that a bank representative can use to consult or open an account for some client
- you can choose how the solution is setup: public cloud, private cloud or hybrid.
  - this is up to you, as this will also modify the content of your document
- your code and tech stack is based on open source solution
  - it can be a "mix" but you have to use some known solution - at least on the languages. The implementation of the app can be a custom internal solution and not some kind of CMS

It is expected from you to work on a global scale and find how the security can be improved - there is currently no security rules being enforced.

Here is a quick list on core feature you will have to thing of, but you can add more than the list below:

- SOC team and responsabilities
- How the security is added on each delivery teams / Security mixed with Dev and Ops
- Process in the company related to security
- Implementation metrics for security
- Enforcing security without impacting the productivity
- ...

You have to show

- how you would add security (ex: what kind of check, with with result)
- where you would add security (ex: which projects, only dev or also cloud)
- how you can control security across the systems (ex: principle of the SOC / SIEM and how to build it)

- what changes you would force on the process (ex: change related to code being pushed, process between engineering and business)
- why it is important to fix them
- display the impact if someone malicious use them to "attack" the company.

3 - Tips

There is no size limit on the deliverables but with less than 10-12 pages you won't be able to explain and present all parts needed to be precise.

You can (and should add) specific images like diagrams to help understand the point you will be making. It is also expected to display some of your possible implementation, be it by using specific solution or process. For example you can

- show the solution
- solving which problem
- that can cause which vulnerability
- with which impact on the company

4 - Deliverables

You need to submit an archive containing all your resources and your finalized document (pdf expected).

You also need to plan a quick presentation slide to submit as if you would present the plan to management - no need in the slide to have a deep dive on all strategy but an overall view. This need to be capable to present your changes and impact in a clear and concise manner.
It is expected to be a slide used by upper / top management to take decision without going into (or needing) specific knowledge about engineering and security.

The end date is the February 13th at 23h59

5 - Graded items

Presentation: 20pts

- Current state of the company: 3pts
- Impact of the current security policies: 2pts
- Technical changes to implements: 4pts
- Process and management changes to implements: 4pts
- Impacts with the current process Engineering / Business: 3pts
- Impactful presentation: 2pts
- Quality of the presentation: 2pts

Report: 20pts

- SOC implementation and role: 5pts
- Security in the teams: 5pts
- Changing technical processes: 5pts
- Control and monitoring of the security: 5pts
